Aniket Garg

+1 480 875 7204 | garganiket27@gmail.com | aniketgarg.dev | linkedin.com/in/aniketgarg1 | github.com/aniketgarg1

Education

Arizona State University — Tempe, AZ
M.S. Computer Science, 4+1 Accelerated Program — *Expected May 2027*
B.S. Computer Science, Major GPA: 4.0 — *May 2026*

Technical Skills

Languages: Python, JavaScript, TypeScript, Java, SQL, C/C++, PowerShell, HTML/CSS
Frameworks & Libraries: FastAPI, Next.js, React, Node.js, LangChain, SQLAlchemy, Pydantic
Cloud & DevOps: AWS (Lightsail), Docker, Docker Compose, CI/CD Pipelines, Apache, PM2, APScheduler
APIs & AI: Google Calendar API, Google OAuth, OpenAI, Gemini, Veo, Lyria, Twilio, Vapi, Deepgram
Systems & Tools: PostgreSQL, Qdrant (Vector DB), Git, Linux, Windows internals (WMI/CIM, PnP), Selenium, FFmpeg

Professional Experience

Ministry of Electronics and Information Technology — New Delhi, India
Software Engineer Intern — *Jun 2026 - Aug 2026*

- Built HIDSentry, a modular Windows endpoint tool (2,600+ lines of PowerShell, 5 modules, zero dependencies) that inventories USB/HID devices via WMI and the Plug-and-Play property store, diffs them against an approved baseline, and scores anomalies with explainable, JSON-configured rules.
- Designed a fixture-replay harness testing hardware-dependent logic with no hardware attached - 6 scenarios, 40+ assertions covering device lifecycle, identity persistence across port changes, and scoring correctness.

L&T Technology Services — Bangalore, India
Software Engineer Intern — *Jun 2025 - Aug 2025*

- Migrated a Fortune 500 client's codebase from Windows to Linux, converting executables into .rpm packages for one-click deployment and ensuring full environment compatibility across Linux servers.
- Resolved critical dependency and environment-specific bugs enabling seamless server startup and full remote power state management (on/off) through the parent application.
- Developed and deployed production-level features including remote server power control and Linux-based chip flashing support, improving platform stability and scalability.

Arizona State University — Tempe, AZ
Undergraduate Teaching Assistant - Fulton School of Engineering — *Aug 2023 - Jan 2024*

- Guided 120+ students on HTML, CSS, JavaScript, and GitHub to build accessible web solutions for individuals with reduced mobility; delivered technical lectures, held office hours, and evaluated submissions with feedback on code quality and design decisions.
- Mentored project teams on collaborative development with Git and GitHub, reinforcing user-centric engineering practices.

Projects

CropSCOUT | HackHarvard 2026 - ASUS Sustainability Winner — Oct 2026

- Designed a precision-spraying rover in SolidWorks CAD and integrated its exported parts into a MuJoCo greenhouse digital twin to simulate plant inspection and targeted spraying.
- Built an on-device tomato-disease screening pipeline using YOLO models exported to ONNX; added confidence safeguards, frame voting, and per-plant spray estimates. Won ASUS Sustainability: Save the Earth.

HocusPocus | HackGT 13 - NSA HEARSAY Challenge — Sep 2026

- Built a macOS voice-authentication prototype (Electron, Swift, FastAPI, Vultr) using a fine-tuned XLS-R 300M model to screen short call-audio windows and flag likely synthetic speech.
- Improved NSA challenge minDCF from 0.258 to 0.1027 (60%) by removing dataset and microphone shortcuts and diversifying training data; achieved 0.50% equal-error rate on 6,567 unseen-speaker clips.

DigiClips Cloud Deployment & CI/CD Pipeline | ASU Capstone with DigiClips Inc. — Aug 2025 - May 2026

- Migrated production deployment from a manual ZIP-based workflow to a Git-controlled system; built a Bash CI/CD pipeline automating code sync, build, service restart, and health checks end-to-end.
- Deployed and managed a full-stack application (Angular + Node.js/Express) on AWS Lightsail; configured Apache reverse proxy and HTTPS routing, and debugged SSL, API routing, and VPN-based database connectivity issues.

Productivity Copilot — Mar 2026

- Built an agentic AI assistant (FastAPI, Next.js, Docker) that converts natural-language goals into milestone-based plans and auto-schedules tasks into Google Calendar using free/busy analysis and daily time budgets.
- Implemented Google OAuth token refresh, deterministic task-ID hashing for idempotent deduplication, and persistent tracking via SQLAlchemy + PostgreSQL; added Twilio voice check-ins via APScheduler.

SparkyAI - AI-Powered University Copilot — Spring 2025

- Deployed a modular multi-agent system (LangChain RAG, Qdrant, Selenium) on Discord, achieving 75% higher response accuracy and 10s lower latency via document reranking; built a Selenium scraping pipeline keeping the knowledge base current with live campus data.
